

## TT201101 – FUP - Hide HTML and Graphic Page

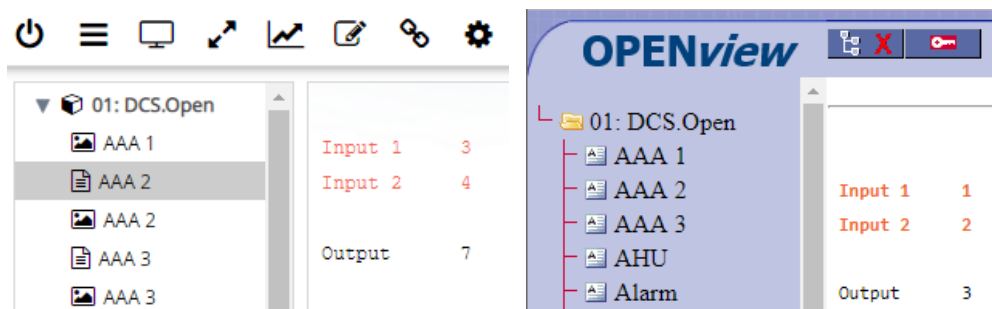

1. If you have many HTML and graphic pages in your FUP page, by default, all of them will be display in the tree automatically, like below

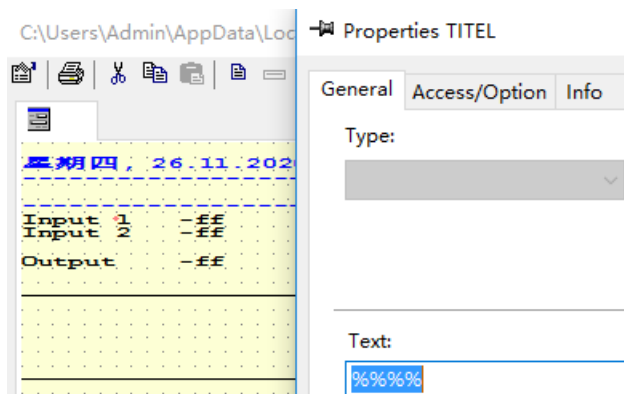

2. Sometimes you may want to hide some of the pages from normal user, to make it easier for the operation and more user friendly. To do it, we have many ways.
3. For the HTML page, we can add the text “#A” to the end of the HTML page title. This can hide the page in graphic mode, but can still see it in text mode

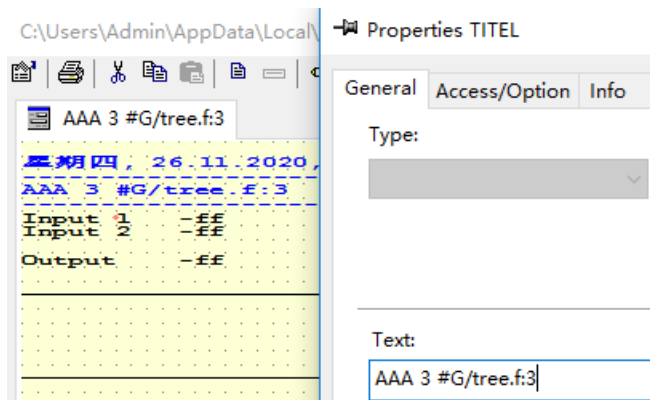

4. Now the HTML page “AAA 1” is hidden from normal user and you can access it in text mode

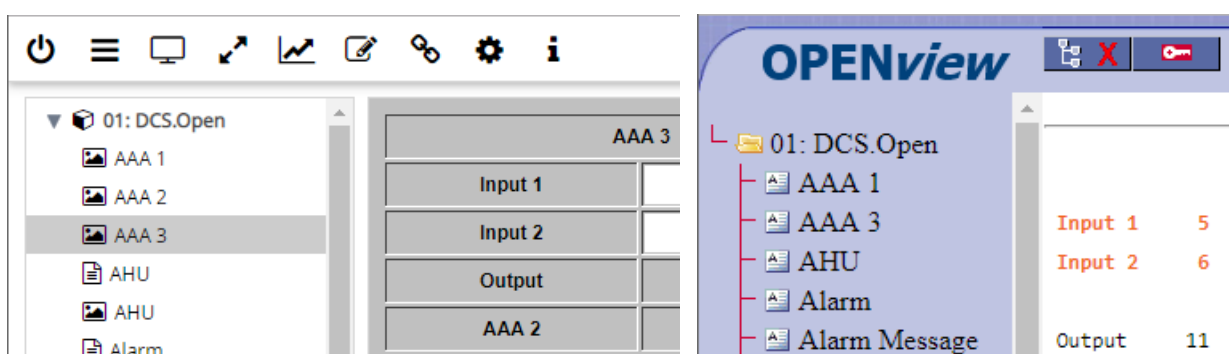

5. Another way is to rename the HTML page title to “%%%%”. This will hide the page in both graphic and text modes

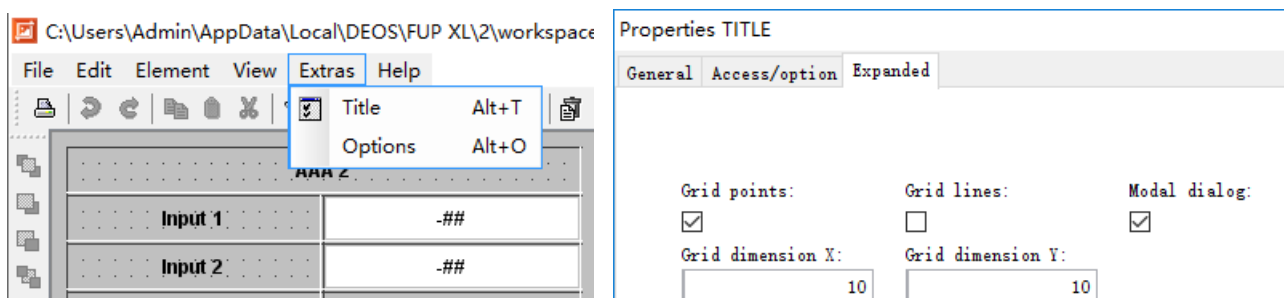

6. The 3<sup>rd</sup> way is to “combine” it a graphic page, so the set graphic page will be opened in the tree in graphic mode. In this example, we add “#G/tree.f:3” to the end to link to the graphic page 3

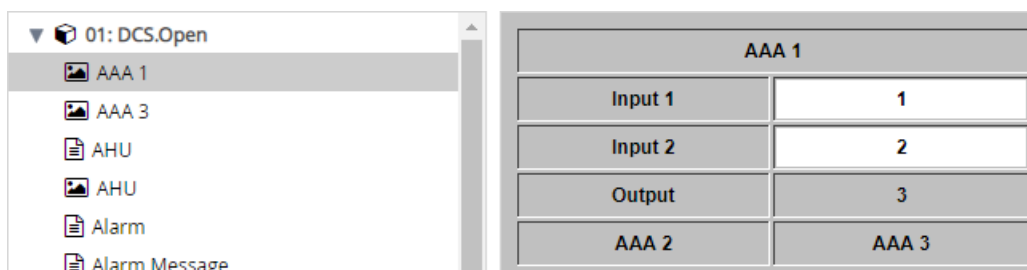

7. Now all the HTML pages are hidden from normal user, but you can still access HTML pages 1 and 3 in text mode

8. For the graphic page, in graphic editor, you can go to TITLE properties, click “Expanded” tab, then enable “Modal Dialog”

9. Now, only graphic page 1 and 3 are visible for normal user, all others are hidden

10. If you want to hide some pages to only some users, you can use the password layer and access level to assign different pages to different password layer. Please refer to “TT190507-FUP-Password Layer & Access Level” for details
