

TT231202 - OPENweb 12 - Manual Install PostgreSQL

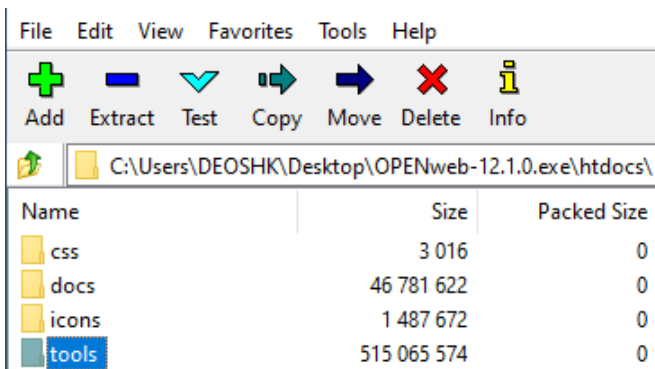

1. If you've got some problem installing PostgreSQL during the installation of OPENweb 12, then you can try to install PostgreSQL manually.
2. To get the installation file of PostgreSQL, you need to use an unzip program. In this example, we use "7-Zip". Right click on the OPENweb installation file, select "7-Zip", "Open archive".

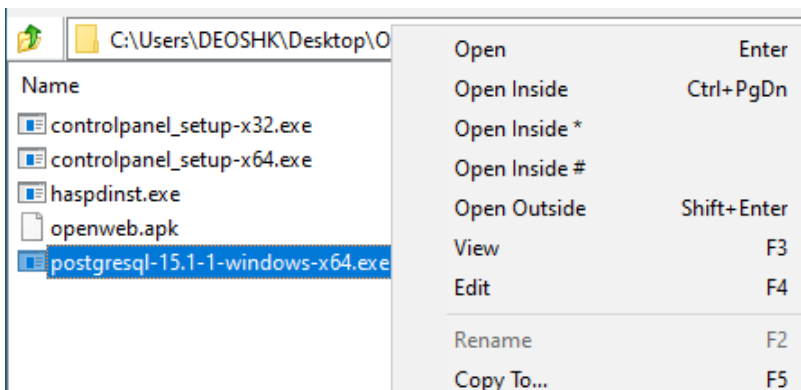

3. Double click the "htdocs" folder to open it.

4. Double click the "tools" folder to open it.

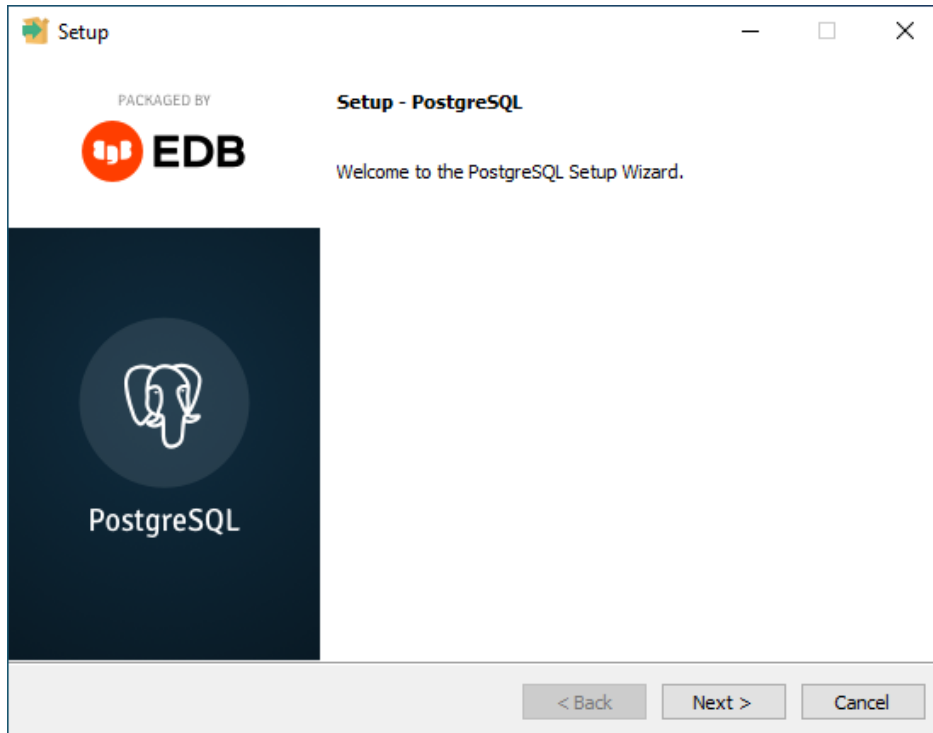

5. Right click on "postgresql-15xxx.exe" and select "Copy To" to copy it to your PC.

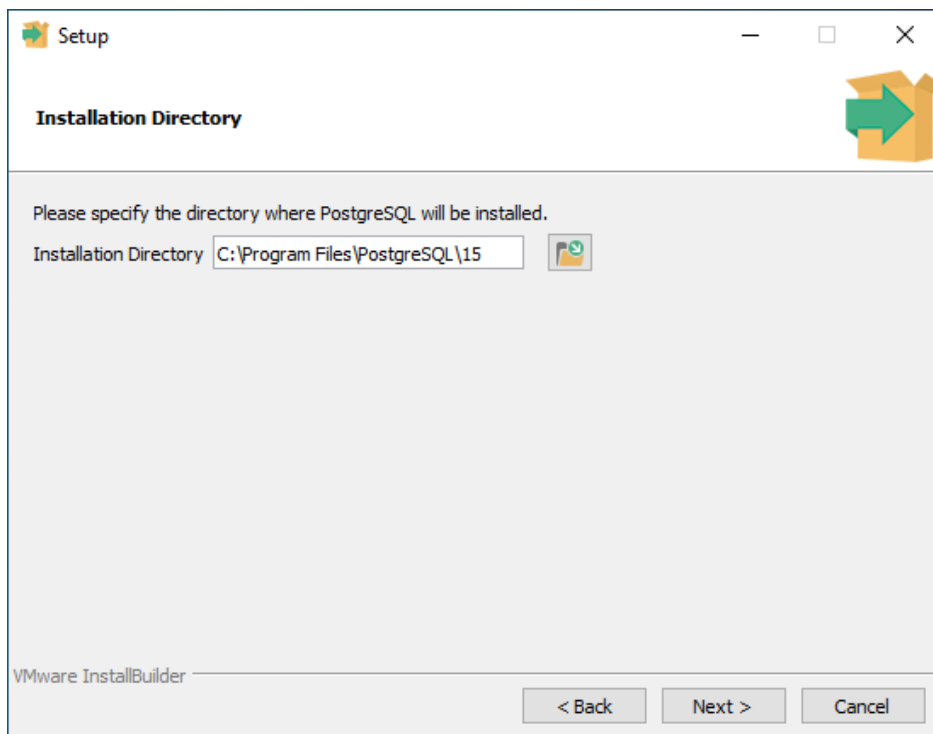

6. Double click on it to install PostgreSQL manually.

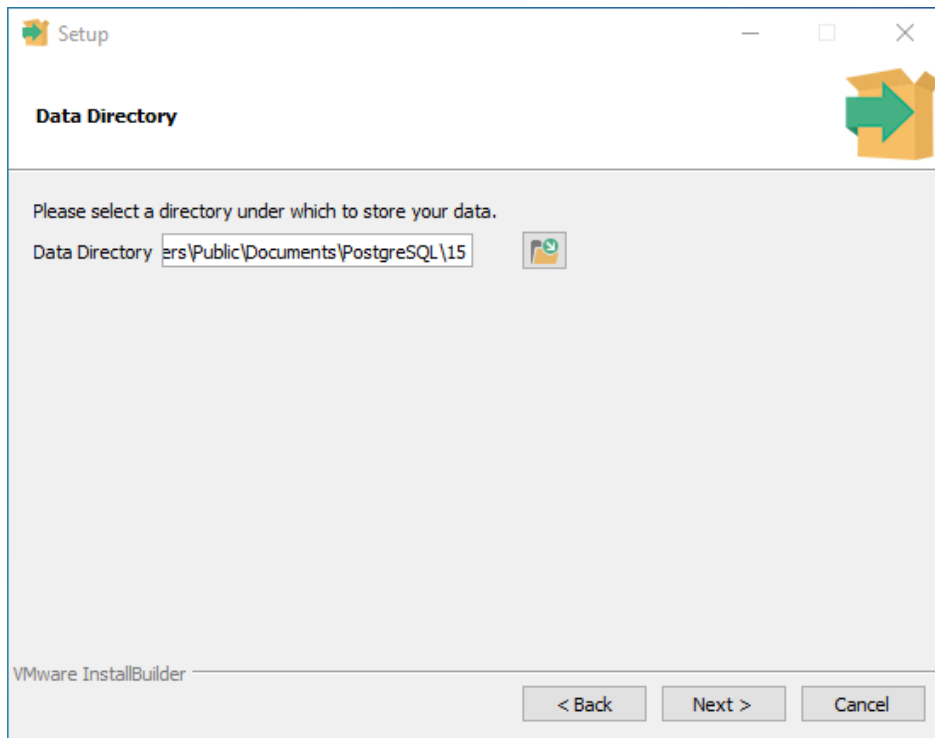

7. Click next.

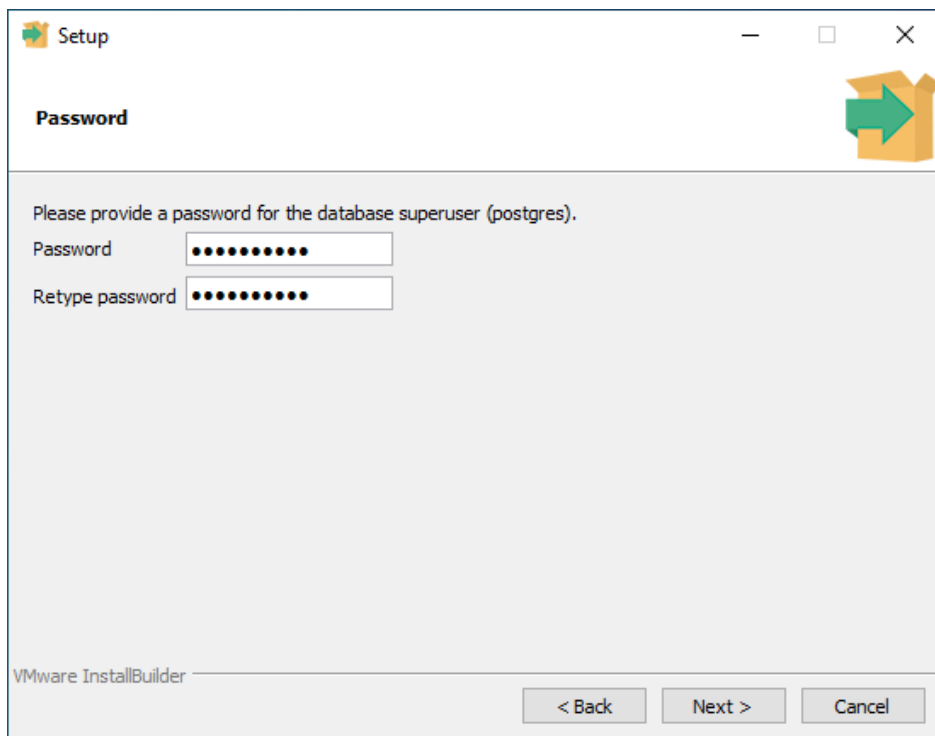

8. Click next to accept the default installation directory.

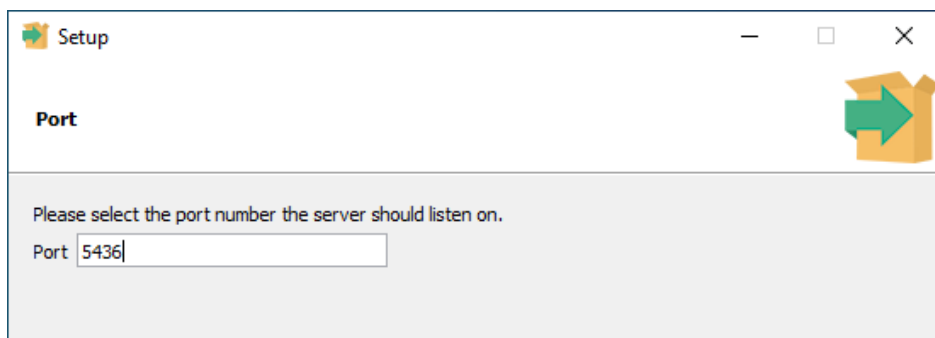

9. Click next again to accept the components to install.
10. Change the "Data Directory" to "C:\Users\Public\Documents\PostgreSQL\15" and then click "Next".

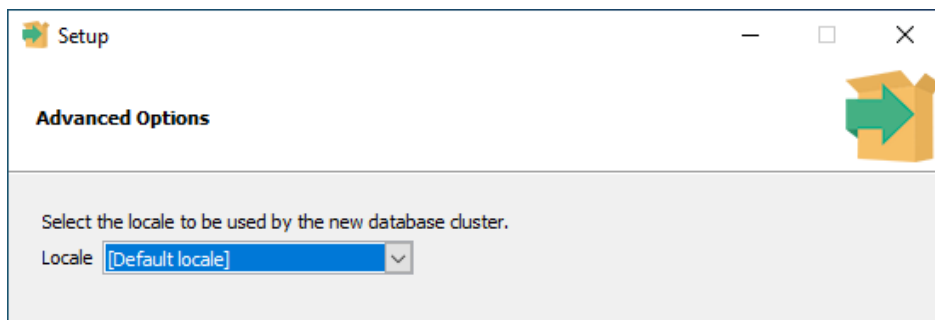

11. Type the password “pgdb8.4@CW” and click “Next”.

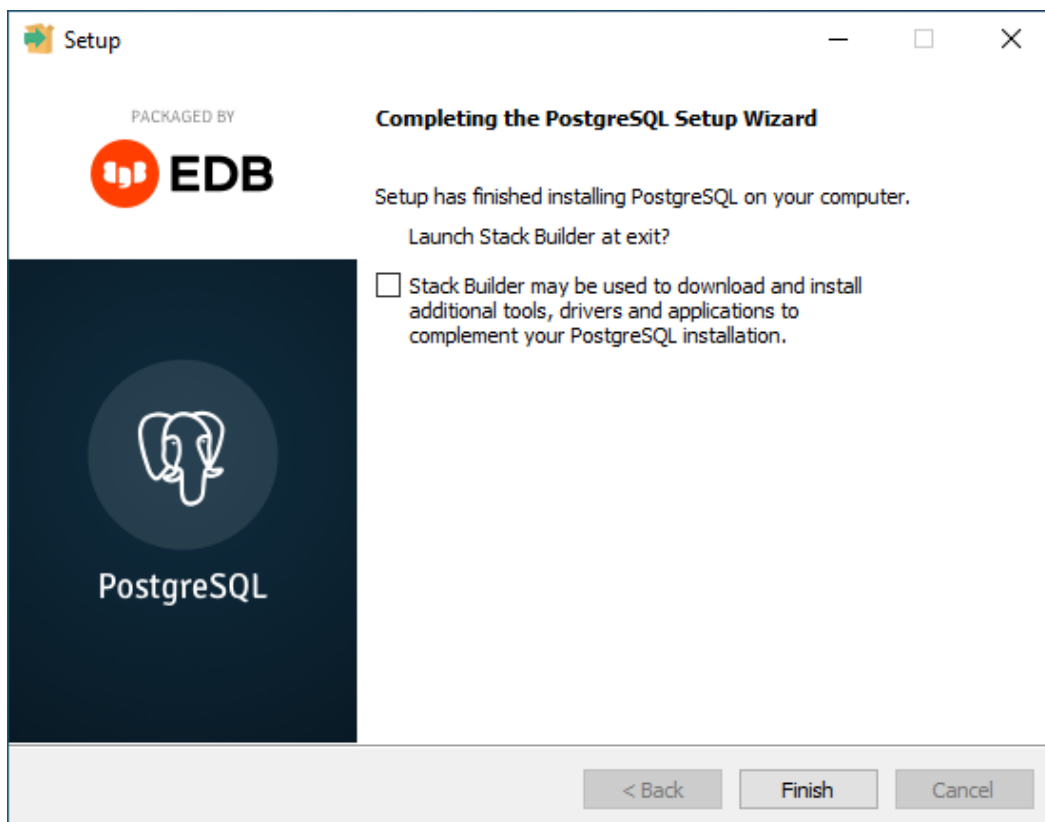

12. Change the port to “5436” and click “Next”.

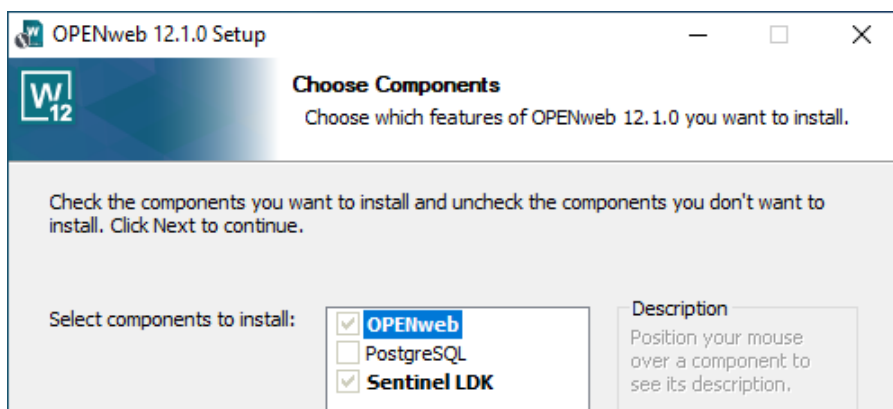

13. Click “Next” to accept the default locale and click “Next” 2 more times to start the installation.

14. Uncheck the “Stack Builder” option and click “Finish”.

15. Now you can continue to install OPENweb 12. Since PostgreSQL is installed already, so the option “PostgreSQL” cannot be selected during the installation.

16. Please note that if you’re installing OPENweb version other than 12, some of the above settings may not be correct (e.g. port number). Please consult technical support for more information.
