

## TT210702 – FUP - HTML Page Tips

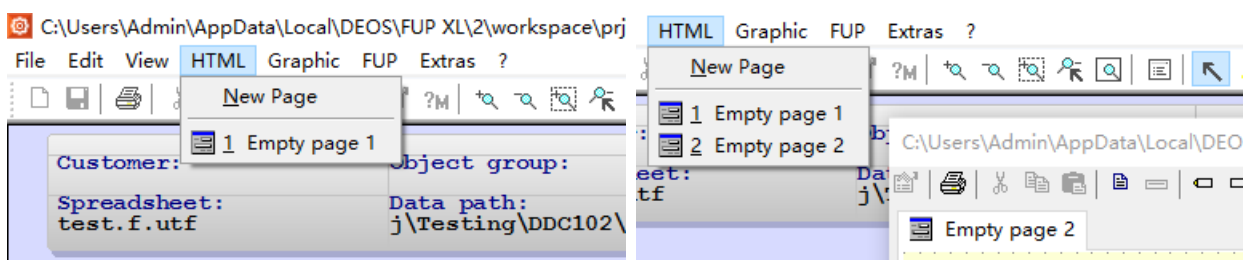

1. HTML page is the basic text base UI for your controller. A well-organized HTML page helps you better manage the system. When you add a new FUP page, there is no HTML.

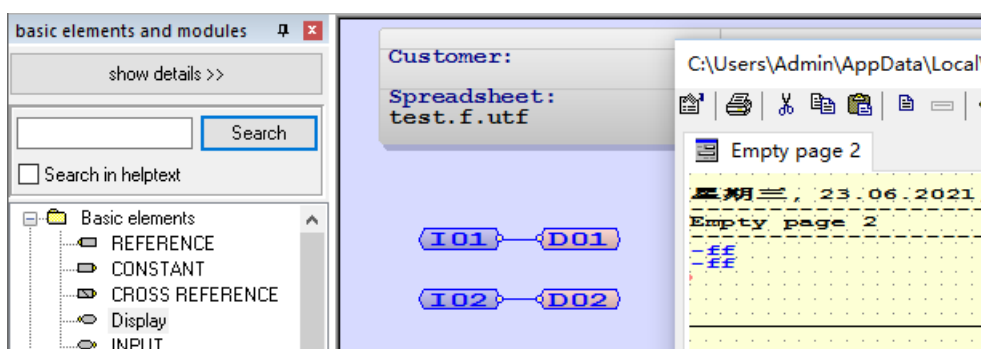

2. Once you've added some "Input" and/or "Display", a new HTML page called "Empty page 1" is created automatically. All subsequent "Input" and "Display" you add in the FUP will automatically add to this HTML page by default.

3. If you've a big program and one HTML page is not enough, you can manually add another page by clicking "HTML", "New Page". This creates a new HTML page called "Empty Page 2".

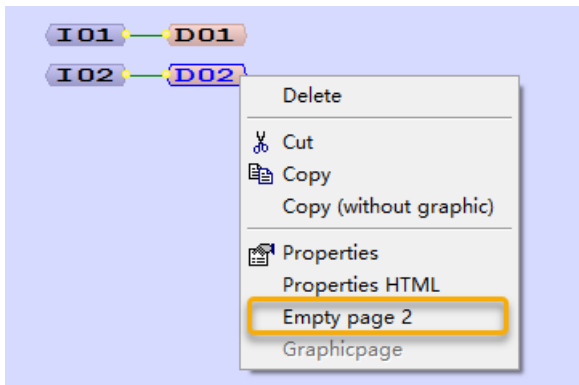

4. To make sure the "Input" and "Output" you add go to this new HTML page, you can open it when you do your programming.

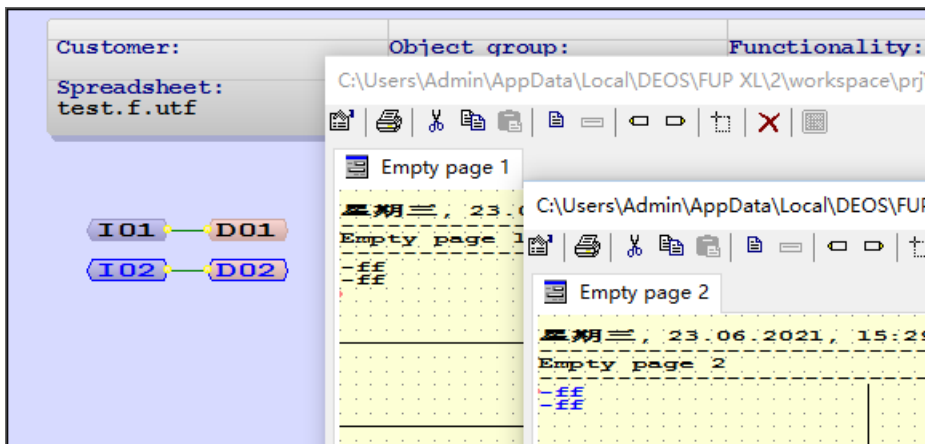

5. If there is no HTML page open during your programming, it will go to the last HTML page automatically (or the last HTML page that you've open).

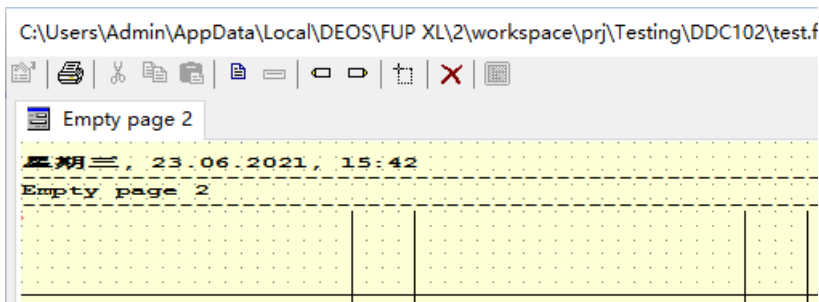

6. If you don't know where it goes, you can right click on it, and check the second last item. In this example, the Display "D02" is in "Empty" is in "Empty page 2".

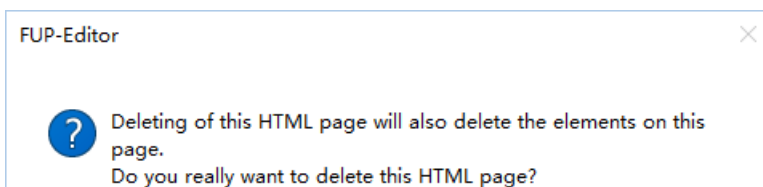

7. You can move them from one HTML page to the other, by holding the "Shift" key, and click on the mouse to move it.

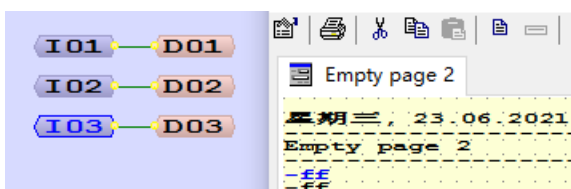

8. If you've an empty HTML page, and you want to delete it, click on the delete icon 

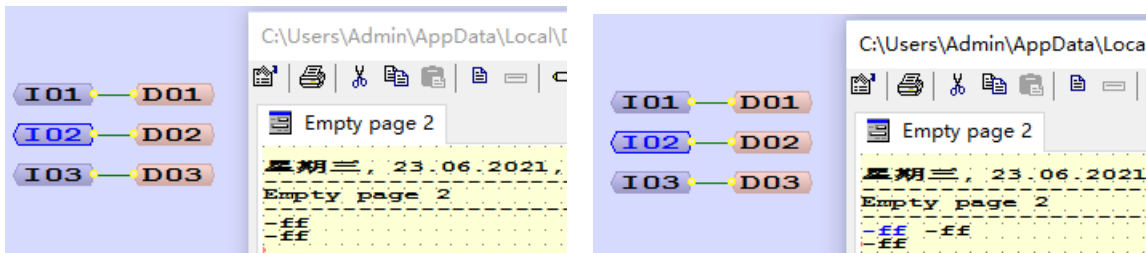

9. Please make sure the page is empty before you delete it. Otherwise, it will also delete the "Input" and "Display" in your FUP page.

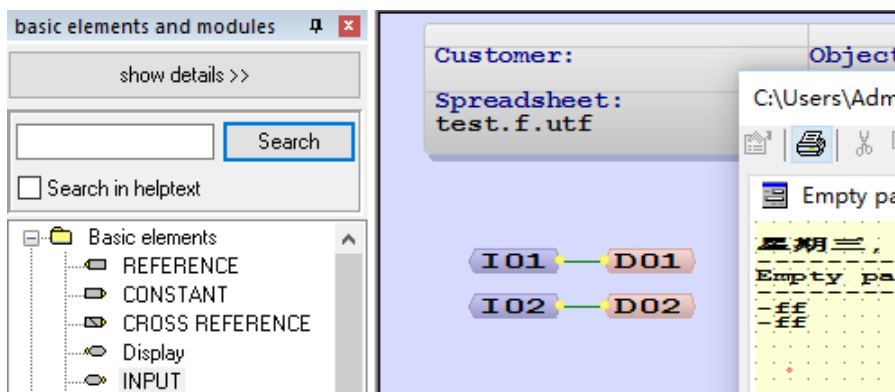

10. Normally, when you click on the "Input", the same element in the HTML page is turn "Blue"

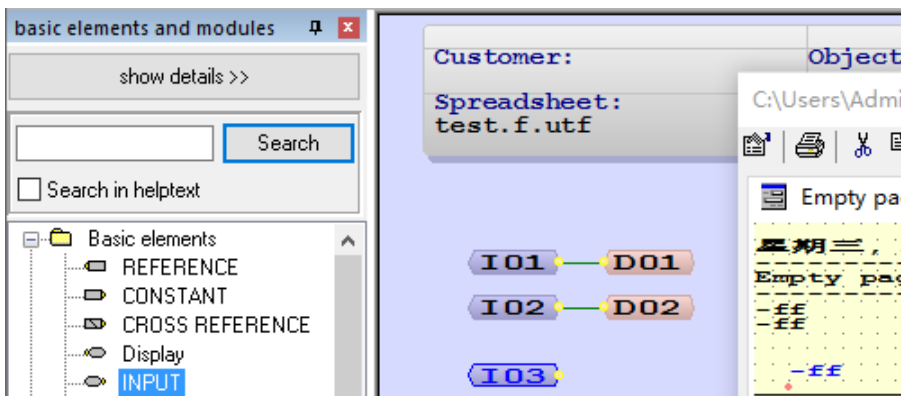

11. If you click on an “Input” (or “Display”) and nothing is highlight in the HTML page, then most likely it is hidden behind some other elements. You can try moving some elements (most likely on the top left corner) and see if you can find it.

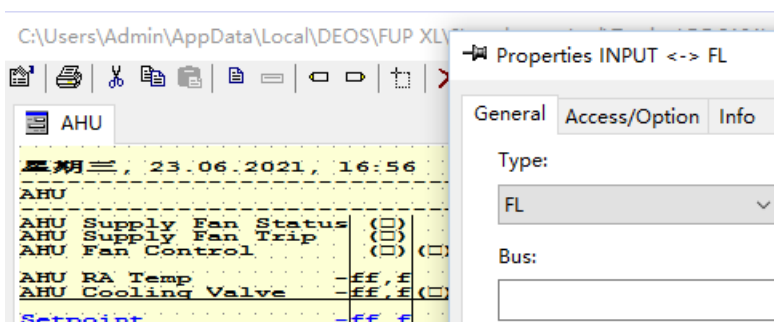

12. To make sure this won't happen, you can open the HTML page before adding “Input” and/or “Display”. Click on somewhere in the HTML page that you want to put the element, and you will see a red dot (like below).

13. Now add an “Input” and you can see it is put exactly at the position you want, and the red dot will move one line below it automatically.

14. Double click on an element to change the properties. You can select multiple elements (e.g. holding the “CTRL” key and select by mouse) and change the properties together.

15. On the top left corner of the “Properties” window, click the  icon to lock the “Properties” window (icon change to ) , and then you can select each element to change the properties.
